

# Designer r31.3.1 Release Notes

---

## [Download r31.3.1 Full \(Pro\)](#)

Full (Pro) build: 226904

Starter build: 226905

Released: September 3rd 2025

## Improvements

- **DSOF - 30889** - The `api/service/project/startlocalproject` API endpoint can now accept the `projectPath` parameter as either a relative or absolute path, rather than just a relative path.

## Fixes

- **DSOF - 31097** - Designer no longer fails to start up on GX 1 servers with a “Error calling ‘`pOutput - >QueryInterface<IDXGIOOutput6>(&output6)`’” error message, as it did before r31.2.
- **DSOF - 31075** - On Windows platforms older than version 1809, calling the `/api/service/media/provision` API endpoint no longer fails to create hard links between files downloaded from the same source.
- **DSOF - 31018** - Layers starting and ending on a section break no longer have their content duplicated across multiple sections in the generated content table.
- **DSOF - 31076** - Applying feed settings with an IP - VFC card no longer fails when the card isn’t generating a genlock signal (e.g., due to misconfiguration or missing external genlock). This restores the behaviour prior to r31.2.
- **DSOF - 31073** - Designer no longer blocks users from adding LumaKey and Placeholder video inputs when all the physical video inputs are also being used.
