

Designer r32.4.8 Release Notes

[Download r32.4.8 Full \(Pro\)](#)

Full (Pro) build: 251212

Starter build: 251213

Released: June 3rd 2026

Items marked with a ● are also included in [r33.1.5](#).

Improvements

- **DSOF - 32691** - Drawing the timeline is now more performant on [Tracks](#) that contain a large number of [notes](#) and [tags](#), reducing the per - frame cost on every machine that displays the timeline.

Fixes

- **DSOF - 32433** - Editors no longer intermittently report media as missing on Actor and Understudy machines when that media is actually present.
- **DSOF - 32437** - The [OpenVPCal Plugin](#) can now capture calibration patterns in a Director and Actor setup. Previously, pattern generation and patching worked but the capture step failed — the screen went black and the capture never completed — on anything other than a solo machine.
- **DSOF - 32457** - Upgrading specific projects created in r18.1 to versions above r30.8 no longer opens to an unresponsive interface with a blank grey background.
- **DSOF - 32652** - Designer machines no longer show a false “Display settings do not match project configuration. Did you remember to Apply Feed Settings?” warning when a GUI head is set to a custom resolution. The warning now appears only when the display configuration genuinely needs [feed settings](#) to be applied.
- **DSOF - 32749 & DSOF - 32778** - Editing [Track notes](#) with the **Ctrl+N** note dialog now behaves correctly. Editing a note at a different zoom level to the one it was created at no longer creates a duplicate note at the nearest second, and clearing a note’s contents and confirming with **Enter** now reliably deletes it.
